There are two types of cells that form the nucleus pulposus. The superior glial cells have an even morphology, whereas the inferior glial cells have an uneven morphology. Eumorphism is the unevenness in cell morphology. The inferior glial cells in the nucleus pulposus are more eumorphic in cells with a round morphology whereas the superior glial cells are more eumorphic in cells with a spindle morphology \[[@B1]\]. The differentiation in cell morphology from round to spindle is a step in maturation of the chondrocytes \[[@B2]\]. In this study, the inferior glial cells in the nucleus pulposus became more spindle shaped and the superior glial cells more round. The superior glial cells in the nucleus pulposus are not known to synthesize proteoglycan, but the inferior glial cells synthesize and secrete more proteoglycan than any other cell types in the nucleus pulposus. In this study, the superior glial cells in the nucleus pulposus had more nucleus than the a1d647c40b

Why does this work? If you have a task that can be split into n^2 parts (i.e. number of ways of choosing 2 parts out of n) you can see that $\text{sum}^{\text{count}}$ is one of them. You can calculate the rest with the same technique. You can think of it this way. Assume there are n^2 tasks. You want to allocate n^2 boxes. How many ways can you do it?

Draw and convert dimensions with a few clicks. No more conversion of dimensions from the coordinate system to layout. (video: 1:10 min.) Send multiple queries at once to multiple people on a shared network drive. (video: 0:40 min.) Redesign a survey with questions that aren't in the survey builder. (video: 1:06 min.) Use the drawing grid or coordinates to send emails and add attachments. (video: 0:45 min.) Print directly from the application. Configure print options such as sheet size and number of copies, choose your printer, and access your print settings from the Ribbon. (video: 1:17 min.) Prepare your drawings to export in Autodesk 360, Autodesk Exchange or Autodesk Cloud. (video: 1:12 min.)
